

When working with **secondary (6-12th grade)** students,

You can NEVER do enough of the following things:

You Can Never Do Enough...	Because...
<p style="text-align: center;">Modeling with NUMBER LINES</p>	<ul style="list-style-type: none"> • It give students a visual representation for many topics • It is easy to draw anywhere, anytime • It is familiar to most students, so it gives most students language to enter and discuss the problem <p>Try it with...</p> <p>Integer Operations</p> 
<p style="text-align: center;">SKIP COUNTING</p>	<ul style="list-style-type: none"> • It is easy to do anywhere, anytime • It can be adapted for students at ANY grade-level • It reinforces pattern recognition and repetition, which can transition into discussions about rules and equations • It flexes the mental math muscle <p>Try it with...</p> <p>Fractions (Be sure to properly name whole numbers!)</p> <p>Starting at a number that is not a multiple of your counter (ex. Skip count by 3's starting at 14)</p> <p>Counting backwards beyond zero, into negative numbers</p>
<p style="text-align: center;">GRAPHING</p>	<ul style="list-style-type: none"> • It is one area that students have multiple opportunities to see outside of the classroom • It is a skill that is necessary for multiple subject areas • It is easy for students to make seemingly small errors that make a big difference <p>Try it with...</p> <p>Different types of graphs and make comparisons ("What do all of the graphs have in common?")</p> <p>Discussing when it is appropriate to use the different types of graphs ("What does this graph explain/show best?")</p>
<p style="text-align: center;">Transitioning between the 5 FORMS OF A FUNCTION</p>	<ul style="list-style-type: none"> • It builds a deeper conceptual understanding of functions <p>Try it with...</p> <p>Starting with any of the 5 representations and creating the others</p> <ul style="list-style-type: none"> ◆ Tables ◆ Graphs ◆ Equations ◆ Context ◆ Language 

Secondary—You can NEVER do enough of the following things: (continued)

You Can Never Do Enough...	Because...
<p>Getting students to EXPLAIN THEIR THINKING</p>	<ul style="list-style-type: none"> • It forces students to think about what they are doing, not just getting the answer • It gives better insight into student understanding and reveals misconceptions <p>Try it with...</p> <p>“What do you notice?”</p> <p>“Think out loud.”</p> <p>“What is going on in your brain?”</p> <p>“Tell me what you are thinking.”</p>
<p>Creating EQUIVALENT EXPRESSIONS</p>	<ul style="list-style-type: none"> • Students struggle with the ideas that 2 things that look different can be equal to one another. <p>Try it with...</p> <p>Fractions $\frac{1}{2} = \frac{2}{4} = \frac{3}{6}$</p> <p>Algebraic expressions $2x + 3 = 5x + 3 - 3x$ or $x^2 = (x)(x)$</p> <p>Rational Numbers $0.75 = \frac{3}{4}$ or $5 = \frac{-5}{-1}$</p> <p>Forms of linear equations (While these are not expressions, this will still help students build the idea of equality)</p>
<p>Assuring students have a FLEXIBLE UNDERSTANDING OF THE BASE TEN NUMBER SYSTEM</p>	<ul style="list-style-type: none"> • A deep understanding of place value is one of the 2 major concepts all elementary students enter middle school weak in. <p>Try it with...</p> <p>Decomposing and composing integers ($542 = 500 + 40 + 2$)</p> <p>Saying 5.62 without using the word “point” (“5 and 62 hundredths”)</p> <p>Using base 10 blocks</p>
<p>Discussing real-life examples of RATIOS, RATES and PROPORTIONAL RELATIONSHIPS</p>	<ul style="list-style-type: none"> • Proportional reasoning is the #1 weakness of high school mathematics students. • Understanding ratios, rates and unit rates deepens students understanding of proportions. <p>Try it with...</p> <p>Grocery store data (cost per ounce)</p> <p>Speed of human running, car driving, etc.</p> <p>Create ratios comparing anything you see around you (ratio of boys to girls, ratio of boys to all students, ratio of pencils to pens, etc.)</p>
